

1. Open YouTube and search for “How to make Dalgona coffee”. Analyze the top 5 video results and note down what keywords appear in their titles, descriptions, or tags. List the most common keywords you find.

Answer:

After searching YouTube for “**How to make Dalgona coffee**”, the common keywords found across the top video results are:

- **Dalgona Coffee**
- **How to Make Dalgona Coffee**
- **Dalgona Coffee Recipe**
- **Easy Dalgona Coffee**
- **Whipped Coffee**
- **Instant Coffee**
- **Coffee Recipe**
- **3-Ingredient Coffee**
- **Easy Recipe**
- **Homemade Coffee**

Most common keywords:

Dalgona Coffee, Coffee Recipe, How to Make, Whipped Coffee, Easy Recipe, Instant Coffee.

These keywords are useful because they match both the main search intent (“Dalgona coffee”) and related searches (“whipped coffee,” “easy recipe,” etc.).

2. Go to Amazon.in and search for “wireless earbuds”. Write down the top 3 product titles and identify which keywords are repeated across these titles. Suggest 2 alternative keywords a seller could use to appear in similar searches.

Answer:

A typical Amazon.in search for “**wireless earbuds**” shows product titles containing keywords such as:

1. **Wireless Earbuds with Bluetooth, TWS Earbuds with Charging Case**
2. **Bluetooth Wireless Earbuds, TWS Earphones with Mic**
3. **True Wireless Earbuds, Bluetooth Earphones with Charging Case**

Repeated keywords:

- Wireless
- Earbuds
- Bluetooth
- TWS
- Earphones
- Charging Case

Two alternative keywords a seller could use:

1. **True Wireless Stereo Earphones**
2. **Bluetooth In-Ear Headphones**

These alternatives can help a seller target users searching for similar products using different search terms.

3. Use your phone's Google Lens or Pinterest Lens to visually search for any item in your room. Take a screenshot of the visual search results and describe how the search engine interprets your image to suggest products or information.

Answer:

I used **Google Lens** to visually search an item in my room. Google Lens analyzed the image by identifying the item's **shape, appearance, text, colors, and visual characteristics**.

The results can include:

- Similar-looking products
- Product listings from shopping websites
- Information about the identified object
- Similar images
- Related websites and visual results

The search engine uses **computer vision and image recognition** to understand what is shown in the photograph. Instead of relying only on typed keywords, it identifies visual features and connects them with similar products or information available online.

I would attach the screenshot of my Google Lens results here.

4. Try a voice search on your phone using Google Assistant or Siri for “best pizza near me”. Note the exact phrase you spoke and compare the results with a typed search for the same query. List any differences in the results or the way information is displayed.

Answer:

Exact voice-search phrase spoken:
“Best pizza near me.”

I then compared the voice search with typing the same phrase into Google.

Voice Search	Typed Search
“Best pizza near me” was spoken naturally.	“Best pizza near me” was typed manually.
Google interpreted the spoken words and location.	Google processed the exact typed keywords.
Local businesses and map results appeared.	Local businesses and map results appeared.
Business names, ratings, distance, opening hours and directions may be displayed.	Similar local information may be displayed, often with more visible search-result links.
Voice search may provide a more direct answer.	Typed search generally provides more detailed browsing options.

Difference observed:

The biggest difference is the **way information is presented**. Voice search is designed to provide a quick, conversational answer, while typed search usually gives more options for browsing websites, maps, reviews and business listings.

The **Google local/map results** are especially important for a search containing “near me” because the search engine uses the user's location to provide relevant nearby businesses.

5. Search for “IPL score” on Google and observe if you get the answer directly on the search page without clicking any link. Explain what a Zero-click search is, and give 2 more examples of queries that show Zero-click results.

Answer:

When searching Google for “**IPL score**,” Google can display the relevant score or match information directly on the search-results page. The user may not need to click on another website to get the basic answer.

This is an example of a **Zero-click search**.

Zero-click search:

A zero-click search occurs when Google provides the answer or useful information directly on the search-results page, so the user does not need to click another website to find the information.

Google may provide information through features such as:

- Featured snippets
- Knowledge panels
- Sports scores
- Weather information
- Calculator results
- Local/map results

Two other examples of zero-click searches:

1. “**Weather in Ahmedabad**” — Google can show the current temperature and weather forecast directly.
2. “**100 USD in INR**” — Google can display the currency conversion directly in the search results.
