**1. Pick a recent trending topic from Instagram Reels or YouTube Shorts and write a 200-word blog post draft about it, making sure to include your chosen keyword at least 5 times.**

**Chosen trending topic:** AI-generated 1980s/retro photo trend on Instagram Reels

**Chosen keyword:** AI photo trend

This trend has recently gained attention on Instagram, where users transform modern photographs into nostalgic 1980s-style images using AI. ([The Times of India](#))

## **AI Photo Trend: Why Retro Pictures Are Going Viral**

The AI photo trend is taking over Instagram Reels and short-form video content, giving photos a nostalgic 1980s makeover. It turns modern portraits into retro-style college pictures with vintage clothes, old bicycles, warm film colours, and classic backgrounds.

What makes the AI photo trend interesting is its simplicity. Users can upload a normal photo, apply an AI prompt, and create an image that looks as if it was taken decades ago. Creators share before-and-after videos, making the transformation easy to watch.

The AI photo trend shows how social media can quickly turn a creative idea viral. Instead of using expensive cameras or professional editing software, users can experiment with AI tools from their phones. This has opened the door for more people to create attractive content.

For brands and bloggers, the AI photo trend can also be useful for storytelling. A business could recreate its early history in a vintage style, while creators can use retro visuals to make their Reels more engaging. However, users should avoid misleading edits and respect the rights of people shown in generated images.

Overall, the AI photo trend is a good example of how AI, nostalgia, and short-form content are shaping social media creativity.

**Word count:** 200 words

**Keyword occurrences:** 5 times

**Keyword density:**  $5 \div 200 \times 100 = 2.5\%$

---

## 2. Calculate the keyword density for the keyword "discount"

### Question:

Calculate the keyword density for the keyword '**discount**' in the following Flipkart-style product description:

"Get the best discount on top mobiles. Discount offers available on Flipkart. Grab your discount now before it ends. Discount valid for today only."

### Calculation

#### Step 1: Count the keyword

The word "**discount**" appears **4 times**.

#### Step 2: Count total words

There are **25 total words**.

#### Step 3: Apply the formula

Keyword Density =  $(\text{Number of times keyword appears} \div \text{Total number of words}) \times 100$

$= (4 \div 25) \times 100$

$= 16\%$

**Answer: Keyword density = 16%**

## 3. Use the free Hemingway Editor to check the readability score of your blog post draft from Task 1.

Hemingway Editor provides a readability score and highlights sentences that may be difficult to read. Its documentation explains that the tool gives an overall readability assessment and document statistics. ([Hemingway Editor](#))

For the 200-word draft above, the **Flesch Reading Ease value is approximately 47** based on the standard Flesch calculation. Hemingway's exact displayed score can vary slightly because readability tools use their own word/syllable processing.

**Flesch Reading Ease:  $\approx$  47**

**Interpretation:** The draft is moderately difficult to read and could be made easier by using shorter sentences and simpler vocabulary.

**Important:** I can't honestly provide a screenshot claiming that I personally ran the text through Hemingway's interactive editor. You can paste the 200-word draft into [Hemingway Editor's free readability checker](#) and take the required screenshot. Hemingway confirms that its free checker provides the readability result in real time. ([Hemingway Editor](#))

## 4. Decide the ideal content length for a blog post targeting the keyword "best budget smartphones in India" by analyzing the top 3 Google search results.

For this task, I checked current search results/pages covering budget smartphones in India. The exact Google results can vary by location, personalization, and time, so the figures below should be treated as **approximate page-content counts**, rather than claiming an exact browser-extension measurement.

### Top 3 relevant results

| Result | Website/Page                                  | Approx. content length |
|--------|-----------------------------------------------|------------------------|
| 1      | 91mobiles – Budget Smartphones in India       | <b>~1,500 words</b>    |
| 2      | Gadgets 360 – Best Smartphones Under ₹15,000  | <b>~1,700 words</b>    |
| 3      | Digit – Best Budget Smartphones Under ₹20,000 | <b>~1,400 words</b>    |

Current pages show that these articles/listings provide detailed phone specifications, comparisons, recommendations and buying information. ([91mobiles](#))

## Recommended length

The average of these approximate counts is:

$$(1,500 + 1,700 + 1,400) \div 3 = 1,533 \text{ words}$$

Therefore, I would recommend writing approximately **1,600–2,000 words**.

This gives enough space to cover:

- Best phones and their prices
- Key specifications
- Camera and battery performance
- Gaming/performance
- Pros and cons
- Comparison table
- Buying guide
- FAQs

**Suggested optimal length: 1,800 words**

The important point is to match the search intent and provide more useful information than simply trying to make the article longer.

## 5. Create a simple content refresh plan for a Zomato-style restaurant listing page.

### Question:

Create a simple content refresh plan for a Zomato-style restaurant listing page. List 3 specific actions you would take to update the content and explain why each is important for SEO.

### Answer:

| Action                           | What I would update                                                               | Why it is important for SEO                                                                        |
|----------------------------------|-----------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------|
| 1. Update restaurant information | Update menu, prices, opening hours, address, phone number and available services. | Accurate information improves user experience and helps search engines understand the page better. |

**2. Add fresh reviews and local content**

Add recent customer reviews, popular dishes, updated photos and location-specific information.

Fresh, useful content can improve relevance for local searches and encourage users to stay on the page.

**3. Improve on-page SEO**

Update the title, meta description, headings, image alt text and keywords such as “best restaurants in Ahmedabad.”

Better keyword targeting and page structure help search engines understand the restaurant page and its search intent.

## **Simple SEO Refresh Strategy**

**Update information → Add fresh user content → Optimize on-page SEO → Monitor rankings and traffic**

This approach keeps the restaurant listing useful for visitors while also giving search engines updated and relevant information.
